

Boomerang & Blueys Residents Group Inc and MidCoast Council

31 March 2020

*Notification by MidCoast Council - Coastal Management
Great Lakes CZMP August 2016*

A Table 1.3 and 1.4 of the Great Lakes CZMP 2016, are intended as a summary of information only. The level of risk to specific land and assets in the coastal zone was identified by combining the likelihood of a coastal hazard occurring and consequence of the coastal hazards if the hazard did occur.

The risk-based approach used in the Great Lakes CZMP was adapted from the Australian Standard Risk Management Principles and Guidelines (AS/NZS ISO 31000:2009) and is explained in detail in the Great Lakes Coastal Zone Management Plan: Options Study 2015 (Appendix A) ("**Options Study**").

For a complete list of assets assessed at risk of coastal erosion and recession, wave runup and over wash using this approach, the asset register in the Options Study should be used. For an assessment of the degree of likelihood of these coastal hazards occurring at various beaches the subject of the CZMP - see Section 2.2 of the Option Study, including the assessment of coastal hazards at Blueys and Boomerang Beaches as unlikely.

B Table 1.4 of the CZMP incorrectly includes the words 'extreme to high risk' in both the heading to the table and in the heading to the 3rd, 4th and 5th columns. The table relates to all levels of risk.
